

HHS Lab Test Rule's Likely Impact During And After COVID-19

By **Gregory Levine, Beth Weinman and Joshua Oyster** (August 31, 2020, 5:35 PM EDT)

On Aug. 19, the U.S. Department of Health and Human Services published a brief announcement on its website that the U.S. Food and Drug Administration, an agency within HHS, will not require premarket review of laboratory-developed tests, absent notice-and-comment rulemaking.

The announcement — published without fanfare on a subsection of the HHS website devoted to coronavirus testing information and without any corresponding press release or Federal Register notice — reflects a substantial policy reversal with significant implications for the FDA's regulation of laboratory-developed tests in the context of the COVID-19 public health emergency and more generally.

Gregory Levine

The HHS Announcement

HHS' one-paragraph announcement, regarding its rescission of guidances and other informal issuances concerning premarket review of laboratory-developed tests, states that the FDA "will not require premarket review of [laboratory-developed tests] absent notice-and-comment rulemaking, as opposed to through guidance documents, compliance manuals, website statements or other informal issuances."

Beth Weinman

HHS states that this announcement is consistent with certain executive orders of President Donald Trump relating to reducing administrative regulation and based on "HHS's ongoing department-wide review of regulatory flexibilities enacted since the start of COVID-19."

HHS states that entities may still voluntarily submit a premarket approval application, 510(k) notification or emergency use authorization request for a laboratory-developed test and that the FDA will adjudicate such a submission. The agency further notes that entities with an active emergency use authorization[1] for a laboratory-developed test to detect the virus causing COVID-19 or its antibodies are unaffected by the announcement.

Joshua Oyster

HHS reminds laboratories:

Those opting to use laboratory developed tests in their laboratories without FDA premarket review or authorization may do so with the understanding that they would not be eligible for PREP Act coverage absent approval, clearance or authorization[2] and would remain subject to regulation by the Centers for Medicare & Medicaid Services under the Clinical Laboratory Improvement Amendments of 1988, 42 U.S.C. § 263a, and its implementing regulations at 42 C.F.R. pt. 493.

Takeaways for the Clinical Laboratory Industry

HHS' recent announcement upends certain regulatory expectations in place since February, when HHS Secretary Alex Azar determined a public health emergency existed warranting the emergency use of in vitro diagnostic tests to detect and diagnose the virus that causes COVID-19.

While prior to the pandemic the FDA was not enforcing premarket review requirements for most laboratory-developed tests, the FDA has taken the position that in a public health emergency, it is particularly important for the agency to review information related to test design, validation and performance characteristics.[3]

As former FDA Commissioner Scott Gottlieb explained in late February via Twitter, in the event of a public health emergency, diagnostic tests "not only diagnose serious or life-threatening disease that's not completely understood, but help guide analyses of disease progression and risks to public health ... False negative results can have significant adverse consequences."[4]

Shortly after Azar's determination that a public health emergency existed related to COVID-19, in late February, the FDA issued the first iteration of its Policy for Coronavirus Disease-2019 Tests During the Public Health Emergency, which was intended to address urgent public health concerns caused by the pandemic "by helping to expand available testing capabilities in healthcare settings, and reference and commercial laboratories." [5]

In this policy, the FDA announced that laboratories certified under the Clinical Laboratory Improvement Amendments and meeting the requirements for high-complexity testing could begin using laboratory-developed diagnostic tests including molecular and antigen tests after successfully validating them and notifying the FDA of such validation, but only so long as they submitted an emergency use authorization request within 15 days of notification.

HHS' recent announcement appears to preclude the FDA from insisting on emergency use authorization submission for lab-developed diagnostic tests, thereby reverting to the prepandemic status quo for laboratory-developed tests.

The announcement, however, also recognizes that certain advantages come with FDA premarket review (like immunity from liability under the Public Readiness and Emergency Preparedness Act) and emphasizes that laboratories still have the option of seeking emergency use authorization, 510(k) clearance or premarket approval for laboratory-developed tests.

To date, the FDA has not issued any public statement regarding HHS' announcement, although published media reports suggest that FDA officials, including Commissioner Stephen Hahn, may have disagreed with HHS' shift in policy. How the FDA will operationalize and implement HHS' announcement and how industry will react to the announcement remain to be seen. Significant open questions include:

Will laboratories continue pursuing emergency use authorizations for COVID-19 tests voluntarily?

HHS' announcement appears to have been intended to increase flexibility for labs developing tests for COVID-19 to decide whether they wish to proceed within or outside the FDA's emergency use authorization framework.

However, significant flexibility already existed under the FDA's COVID-19 test policy.

That policy enabled a Clinical Laboratory Improvement Amendments-certified lab meeting the requirements to perform high-complexity testing to begin patient testing with a diagnostic laboratory-developed test prior to the FDA's issuance of an emergency use authorization, provided that the lab first notified the FDA that it has validated the test under the Clinical Laboratory Improvement Amendments and then submitted a emergency use authorization request within 15 business days of the notification.

It also permitted such a lab to begin patient testing with their diagnostic tests for COVID-19 without the need for an emergency use authorization request at any point, if the laboratory was authorized to do so under state authority.[6]

Finally, existing policy permitted a lab to use laboratory-developed tests for detecting antibodies against COVID-19 without the need for an emergency use authorization request, so long as the lab notified the FDA that it has validated the test under the Clinical Laboratory Improvement

Amendments and included certain information in test reports.

However, the FDA required that laboratories not testing solely under state authority notify the FDA about their validation efforts, and developers of diagnostic laboratory-developed tests were expected to submit emergency use authorization requests, enabling the FDA to grant or deny emergency use authorization depending on test performance.

HHS' announcement removes the FDA's ability to require that diagnostic test data be submitted in an emergency use authorization request and thus takes away the FDA's ability to prevent a test from being used and marketed if the FDA has concerns with the data submitted.

While the potential benefits of PREP Act immunity and the imprimatur of the FDA's authorization may provide incentives for some labs to continue pursuing the emergency use authorization pathway, other labs may determine that the burdens of preparing an emergency use authorization and having to comply with its conditions outweigh the potential benefits.

What impact will the announcement have on at-home sample collection for COVID-19 laboratory-developed tests?

HHS' announcement is unlikely to impact the FDA's premarket review of at-home sample collection kits. The FDA has historically regulated specimen collection containers and kits as medical devices distinct from laboratory-developed tests, and we expect that the FDA will conclude that such sample collection kits fall outside the scope of HHS' announcement.

However, under the FDA's COVID-19 test policy, the agency did not extend pre-emergency use authorization enforcement discretion to tests performed on samples collected at home, whether observed by a health care provider via telemedicine, or wholly unobserved. The FDA has issued emergency use authorizations for several at-home sample collection kits for anterior nasal swabs, and as a condition of these emergency use authorization, the agency has insisted that labs obtain emergency use authorization for each test intended to be used with such authorized kits.

The FDA has also issued emergency use authorizations for tests that are intended for use on saliva or nasal swab samples collected at home, via at-home collection kits authorized within the same emergency use authorization.

While the FDA may continue to insist on premarket review for any kits that are not exempt from premarket review by regulation, it is not clear that the FDA can preclude a laboratory from running an unauthorized test on specimens collected at home, using a kit that is emergency use authorized or 510(k) cleared for at-home collection of specimens intended for COVID-19 testing.[7]

Can laboratories test pooled specimens and market their tests for screening of asymptomatic patients without FDA premarket review?

To the extent laboratories decide to proceed outside of the emergency use authorization framework, the HHS announcement suggests that the FDA will be hard-pressed to restrict use of laboratory-developed tests on pooled specimens so long as labs appropriately validate their tests on the pool sizes employed. Similarly, the announcement suggests that the FDA will be unable to restrict use and marketing of properly validated laboratory-developed tests for screening of asymptomatic patients.

How will the FDA interpret the scope of the term "laboratory-developed tests"?

The HHS announcement does not define the term "laboratory-developed tests." The FDA might interpret that term narrowly, in line with the agency's longstanding definition of a laboratory-developed test as a test designed, manufactured and used within a single laboratory. The FDA is aware, however, that modern laboratory companies often operate in networks with multiple locations.

One question the FDA will likely need to resolve is whether a test developed for use in multiple laboratories, rather than a single location, will be considered a laboratory-developed test that does not require premarket review under the new HHS policy.

What specific FDA guidances and other informal issuances will be rescinded or revised?

Notwithstanding that the title of the announcement begins with the phrase "Rescission of Guidances and Other Informal Issuances," the words "rescission," "rescind," and similar terms appear nowhere in the body of the announcement. HHS does not identify what specific FDA guidance documents, compliance manuals, website statements and other informal issuances are being targeted by the announcement, nor does HHS specifically direct the FDA to rescind or revise anything.

Nonetheless, in light of the announcement, the FDA may rescind or revise certain of its guidance documents and other statements that expressly or impliedly suggest that laboratory-developed tests may be subject to premarket review.

For example, in October 2014, the FDA issued a controversial draft guidance proposing a framework for regulatory oversight of laboratory-developed tests, including, among other things, premarket review. The FDA announced in November 2016 that it would not finalize this guidance document, yet the draft has never technically been withdrawn or rescinded.

Then in January 2017, the FDA issued a discussion paper regarding another proposed framework for laboratory-developed tests that included, among other things, premarket review. In light of HHS' announcement, the FDA may formally rescind these documents or at least revise the discussion of premarket review therein. Additionally, the FDA's COVID-19 test policy is likely to be revised to address HHS' announcement.

Will HHS' shift in policy be maintained if there is a new presidential administration in January?

Whether a Democratic administration under Joe Biden would disagree with HHS' deregulatory announcement and decide to rescind it remains to be seen. Notably, the Democratic Chairman of the House Energy and Commerce Committee, Rep. Frank Pallone Jr., has already raised concerns about HHS' announcement.

On Aug. 20, Pallone demanded a briefing from HHS Secretary Azar regarding the announcement and "an explanation of why HHS is doing this now when the need for accurate tests is so critical." [8]

Potential Impact Beyond the Current COVID-19 Emergency

HHS' announcement does not question the FDA's long-standing position that it has the statutory authority to regulate laboratory-developed tests as medical devices, and that its historic laboratory-developed test policies have been grounded in enforcement discretion. Nor does the announcement address any aspect of FDA regulatory oversight other than premarket review.

Further, the announcement acknowledges that the FDA could, at least theoretically, seek to impose premarket review requirements for laboratory-developed tests through notice-and-comment rulemaking, though FDA efforts to assert its regulatory authority over laboratory-developed tests have stalled in recent years and the FDA appears to have resigned itself to waiting for congressional action.

It is possible HHS' announcement could spur Congress to take such action. However, with an election looming in just over two months, the passage of laboratory-developed test legislation by the current Congress, such as the VALID Act introduced earlier this year, remains unlikely.

In any event, in the near term, HHS' policy shifts are likely to make enforcement of premarket review requirements for laboratory-developed tests virtually impossible even if a new administration reverses course. Further, labs that do not pursue emergency use authorizations or 510(k) clearance will also lose the advantage of clearly defined conditions of use and authorized labeling that may serve as a sort of safe harbor as they market and implement their testing services.

While the FDA will not be able to pursue enforcement for failure to comply with premarket review requirements, false and misleading labeling and promotional claims will continue to be fair game for the FDA, Federal Trade Commission and the U.S. Department of Justice under applicable consumer protection and fraud statutes.
